

Practical Course: Logic App Development

Exercise sheet week 9

To be completed before 15th December 2023, 11am.

1. This week, you will continue with adding features to the dice app. The solution to this week's task should be in a folder **week9** in your repository; copy all necessary parts from last week to a new project. If your app does not yet satisfy all the mandatory properties of the previous weeks, you also need to include the missing functionality. This week's task is to persist the statistical information on a phone; this functionality does not have to work on the web.
 - If the user closes the app and restarts it, they should be able to see the previous statistical information. Your app does not have to store the complete undo history but only the latest statistical information. The two possible choices for implementing this feature would be SQLite

`https://docs.flutter.dev/cookbook/persistence/sqlite`

or `shared_preferences`

`https://docs.flutter.dev/cookbook/persistence/key-value`

You can use any of these two options (do not use direct file storage).
